

Basics of Bootstrap

Some basics of bootstrap include Navbar, which is a component that creates the search bar for a webpage, Card holds information in a card like format making it easier to display info in a organized structure, Modal which creates pop ups that display more info without opening another page, Alert which displays warnings and such, and Carousel which created image sliders that you can cycle through to show more images that might not fit on the page conventionally.

The bootstrap grid system works by creating layouts for your pages and functioning on all kinds of devices. You use Columns that you place the info you want to display in and use classes so that they adapt to whatever device they'll be displayed on. I love how I can keep adding onto my website and making it look better and better. Learning how to add these components is really fun.
